

Another advantage of Domoticz is that it's lightweight. It can be run on many a low power device like the Raspberry Pi. The software is written using C/C++ language and the source code could be procured from GitHub.

Calaos

Calaos is another open source software that's actually designed as a full-stack home automation platform. This includes the touch-screen interface, a server application, web application, native mobile applications for Android and iOS ... allow us to catch our breath here ... and the Linux operating system that's preconfigured to run underneath. But there is one issue: the English documentation available is limited-many of the instructional materials and support forums are in French. You can view the source of Calaos on GitHub. It's licensed under the version 3 of GPL.

A full-stack home automation platform

OpenMotics

Making both the hardware and software of the home automation system, OpenMotics are under open sources licenses. These provide a rather comprehensive system using which you can control devices. The main advantage, of course, is that you don't have to stitch together different devices from various providers. Whereas many systems are designed mainly for easy retrofitting, with OpenMotics the focus is on a hardwired solution. The license for OpenMotics' source code is under GPLv2. It's available for download on GitHub.

Provides a comprehensive system to confirm the devices

Home Assistant

Home assistant is yet another open source home automation platform.
