

Integrates well with a large number of offerings

It's designed in such a way that it can easily be deployed on almost any machine that can run Python 3. This could range from a Raspberry Pi to a NAS device.

Home Assistant integrates well with a large number of open source and commercial offerings- giving you a wide array of choices to pick from. For instance, you can easily use it to link weather information etc. to controls on locks or lights. Released under an MIT license, Home Assistant's source code is downloadable from GitHub.

How homegrown players are leveraging such platforms to bring interesting service mixes to you

In India, the home automation segment is largely spearheaded by startups. The segment is still in its nascent stage, so we are bound to see many more players enter the fray. But among the ones that exist today, there are a few who try to bring excitement- and good software to the sector.

Oakter

This tech startup is based out of Noida and was founded in 2014. The company primarily brings plug & play smart home products for the Indian homes. Using these products your existing home appliances would become even smarter since they could be controlled remotely using a mobile app. The product mix includes a smart plug, plugged-in sensors and the mobile app.
