

Electronics components for DIY automation

- Resistors have a colour coding on them, which indicates the resistance of the resistor. A guide on how to understand this system is available at <https://learn.sparkfun.com/tutorials/resistors>
- **Microcontroller / microprocessor board**
 - Microcontroller / microprocessor board are the brains behind electronic systems. They decide on the action to be performed based on data from the sensors.

Resistor, capacitor and inductor representation

- Microcontroller boards called Arduino and ARM microprocessor based boards called Raspberry Pi are among the most popularly available boards used for electronics DIY.
- There are extensive resources available on use of these two boards. We at digit had written a Fast track to both Arduino and Raspberry Pi about two years back which can be found on the DVD.
- **Breadboard**
 - Before an electronic circuit is assembled on a printed circuit board (PCB), it is first tested on a breadboard.
 - A breadboard can, therefore, be called a prototyping board for elec-
