

The Jetsons seem pretty outdated with respect to what today's tech has to offer

their doorbells and be visually alerted instead. The possibilities really are endless. There are tonnes of beautiful lighting setups that DIY enthusiasts and hobbyists have built. There was this one setup where the guy connected the smart lighting in his home to his gaming console and the lights blinked red every time he got a headshot. Sounds cool, doesn't it?

Also, if you have smart TVs lying around your house you can now do all kinds of crazy stuff by hooking them up together via a HUB. You can control all such smart gadgets now through your smartphone if you are willing to go the distance. Sound systems, gaming consoles, lights, windows; you name it and you probably have a product available in the market for it. However, this market has not yet been tapped into completely. There is still a large room for improvement by making such services more accessible to the common homeowner as not everyone is that much into DIY. Maybe we still need to discover more convenient and elegant arrangements before this becomes a household phenomenon.

The future perhaps has more internet controlled home appliances. Smart kitchens are probably the future. There have been talks of a fully automated kitchen where you just decide on the dish you want to prepare and your smart kitchen guides you through the process smoothly. Imagine how convenient it would be to not have to remember whether you turned off the gas. This kind of technology deals with ensuring the safety of the entire house, hence it is not allowed to malfunction. So, a venture will probably be made towards greater automation once all the safety criteria can be met.
