

Robots

Robots have been a thing of the future for almost half a century now. No more. We already have fully functional well equipped robots that we can purchase online to make our lives better and easier. There is the example of the cleaning robot, which detects dirt and dust particles on your floor and vacuums accordingly so you don't have to vacuum your carpet ever again if you keep your tiny friend charged. Also, there are table top robots which function as portals to connecting with other devices and can give you notifications and alarms.

And the whole concept of IoT is to make all such technology interconnect and make the entire process as smooth and flawless as possible. You enter your room, the lighting turns to a soothing orange, and then your favourite Saturday music starts playing. It's about taking something simple and connecting it with other simple things to create something grand. This is probably the reason that better, more creative robots won't stop coming anytime soon. The saturation point to this technology seems nowhere to be seen.

There are a variety of interesting robots for your home right now. These are a few examples:

Aido - the family friendly robot

Jibo

Jibo is a family robot which is also a storyteller and is programmed to entertain kids. It is a microphone, camera and personal assistant all combined into one. It is designed to give you updates and notifications and provide you with a sort of a telepresence. It is equipped with facial
