

Maybe some people will start keeping them as pets

battery life which is way more time than you would usually spend at the grocery store. It would be cool to see a future with these kinds of robots in it.

Security

Security is one of the main reasons behind the need for home automation. As a matter of fact, the very first instance of home security gadgets was the fire alarm system which paved the way for more complex technology. Then we saw a rise in home security systems in the 2000's and now the movement has developed into a complex and diverse industry. We already have smart thermostats and smart door locks. We can have as many surveillance cameras installed in our homes as we want and monitor them whenever we want on our smart TVs. There are many security bots being developed that are equipped with security surveillance cameras and have patrol duties so that they can detect any kind of intrusions. Drones are also being used for home security as they provide ways to secure your house that are unavailable otherwise. Smart locks are already being used in addition to the traditional lock and key. An ideal secure smart house should make the house accessible to only the home owner and must have an efficient way to deal with breaches.

The future might have a lot more of such home robots and better access mechanisms to make the doors and windows completely intrusion free.

Future problems

The harsh truth about smart houses is that it is possible to hack them. There have been a lot of scary cases when someone's privacy has been compromised through the access of smart house appliances. The internet has a tonne of step by step tutorials to guide you through hacking someone's smart house. So, precaution is a must. There are certified services which take such threats very seriously and if you decide to turn your house into a smart house, you must get it done through a trusted vendor, unless you have the time to take all the necessary precautions yourself. These vendors charge you for their service but they also make sure that their devices are not altercated with and have been tested for security scenarios. The future could maybe have
