

more of such breaches where the user doesn't take enough precautions. We can only hope that the smart house doesn't get as easily hacked as someone's iPhone or Dropbox account. Because this is your home we are talking about. The modern-day thief need not be equipped with a ski mask and a crowbar. A simple smartphone and an IPMask might suffice.

Also, if you use devices that store your preferences and other important stuff like photos or passwords, you must make sure that they do not fall in the wrong hands or are breached by hackers. You can make sure this doesn't happen by securing your hub. Be sure to use a good hub in the first place and

Your Wi-Fi password just became a lot more important

not just any Chinese knock off. In case you use your smartphone to access the home network, make sure that your smartphone is insusceptible to any intrusive attacks. But developers are quick learners and efforts are made increasingly to access all possible threats and build a truly secure home system that turns your home into your own personalized Fort Knox.

SAVE ENERGY

A normal household wastes a whole lot of energy by just not turning off the lights when not in use. This simple wastage can be completely curbed out using smart lighting technology. Not only in lighting, all your electronic appliances can be programmed to turn themselves off when not in use or when you are away from home. It's true that all these smart appliances cost a lot more than normal appliances would, but in the long run, they do help you consume lesser energy and make your experience every bit better. You could program the lights to dim down as they sense that you have dozed off while reading a book in your study. It really comes down to how creative you can get. The DIY guys are having a blast with this technology and there are some spectacular examples of how people have modified the way they live their lives. From smart fridges to smart wardrobes to smart pet collars, there is a smart everything nowadays (it didn't work as good for smart watches though).
