

Bring down that electricity Bill

It's just about making it accessible to the average guy. The major possible problem is that there is no one best arrangement or formula that works for everyone right now.

SMART CITY

Imagine a city, being completely interconnected with each other, functioning like a brain, with every house acting like a node. Imagine the level of competency that can be achieved if such a utopia was established. You could figure out a crime before it happened. With that amount of surveillance, you wouldn't need cops anymore. Just drones flying about on their patrol and reminding everyone to mind their business. This utopian dream may very well turn into reality in the decades to come. It would be hard to even predict the new kind of technology that would cater to such an interconnected society. Communication would change, transportation would change, basically the way we live our lives right now would seem ancient. This change would be almost as big as when people started using cars instead of horses. A true smart city is still a long shot away but there have been instances of governments taking special attention in achieving this goal to build a better, more interconnected society.

CONCLUSION

You can start with a simple smart lock and take your own way while accepting the changing trends. But one thing is for sure, like it or not, this trend is here to stay. It's the logical next step and a lot of people and big shots like Google and Tesla are working towards achieving the goal of a better future. We cannot overlook the fact that these measures help us in saving energy which should be reason enough to bring them into our lives. It can be concluded that smart homes are no longer a thing of the future, and if the execution is done right, they are pivotal in bringing about a much-needed change in our lives for the best. **d**
