

Lambdas with TypeScript

TypeScript also has support for lambda. For those unfamiliar with the word, lambdas are a neat way of writing clean and easy to understand code by using undeclared functions. We suggest you read up on this latest fad which seems to take over whichever language you look at.

An application of lambda is the HTTP GET. HTTP get supplies a RxJS subject. With help of the toRx() method, we can transform it to an Observable. After this we can subscribe to this observable by using the .subscribe. Every change can now be mapped.

```
• http.get('someUrl').toRx().map(res => res.json()).
  subscribe(result => this.doSomething(result));
```

Angular 2, directly uses the valid HTML DOM element properties and events.

Another major change in Angular 2 is, that it directly uses the valid HTML DOM element properties and events. Thus, many of the available built-in directives in Angular 1.x are now no longer required. For example, Angular 1.x uses ng-href, ng-src, ng-show and ng-hide, but Angular 2 uses href, src and hidden properties to get the same output. And same goes with event based directives like ng-click and ng-blur.

```
• <button ng-click="doSomething()">
```

And in Angular 2, take the HTML event and wrap it with parentheses.

```
• <button (click)="doSomething()">
```

Angular 2 is mobile oriented & better in performance.

Angular 1.x was not designed with mobile support in mind, but Angular 2 is completely mobile ready. Among other things Angular 2 implements unidirectional tree based change detection which increases performance.

Native script is a library that is designed to make developing applications on Angular blazingly fast. It also allows you to render the same template differently on different mobile devices.

Apart from these, the syntaxes for local variables, built in directives etc have undergone changes, and so has the routing syntax.

For further in - depth knowledge of the topics listed here, we strongly recommend that you follow the official documentation for Angular 2.0

Alright let's get started!
