

Explanation:

- Import Component, Directive, Renderer and ElementRef. All of these are required.
- Use the @Directive annotation to define the annotation and specify the selector with [] square brackets. This will associate the directive with the size attribute.
- Create the class for Directive to set the element style.

Highlights

- Import the Directive decorator.
- Add @Directive annotation, including CSS attribute selector ([]) that defines our directive as an attribute. Input properties and host mapping can be added to @Directive annotation.
- Specifying the name of public input property for binding.
- Directive class.
- Decorator can be applied the directives or component.

Creating file app.st

```

import {Component} from '@angular/core'
import {Sizer} from './sizer'

@Component ({
  selector: 'digit',
  provider: [],
  Template: `
<div>
<p sizer>Hi {{name}}</p>
</div>
`,
  directives: [Sizer]
})
export class App {
  constructor() {
    this.name = 'digit'
  }
}

```

Example Code (Directive with Attribute Parameter):

Simple attribute is added that specifies the size of the font.

There are two ways of passing input to a directive:

- Using and @Input annotation
- Input element of the @directive annotation.
