

```

• this.form = fb.group({'make' : ['',Validators.
compose([Validators.required, MakeValidator.isNotMer-
ceded])],
•           'model' : ['', Validators.required],
•           'year' : ['',
•           'vert' : [false],,));}

```

You can also modify the template 'app.html' for adding a validation message:

```

• <div class="form-group">
•     <label for="make">Make</label>
•     <input type="text" id="make"
placeholder="Car Make" [ngFormControl]="form.
controls['make']" required>
•     <div *ngIf="form.controls['make'].
hasError('isMercedes')" class="ui error message">No Mer-
cedes!</div>
• </div>

```

Pipes

Pipes are useful for transforming data, especially when the same transformation is used throughout the application. Pipes make it easy to add these transformations into the Component Template.

Types of Angular Pipes

1. LowerCase

```

•     template:<div><h2> Hi {{name | lowercase}} </h2></div>,

```

2. UpperCase

```

•     template:<div><h2> Hi {{name | uppercase}} </h2></div>,

```

3. Currency

```

•     template:<div><h2> Hi {{salary | currency}} </h2></div>,

```

4. Percent

```

•     template:<div><h2> Capacity {{capacity | percent}}
</h2></div>,

```
