

DIRECTIVES IN DETAIL

Delving deeper into the near limitless
functions in Angular 2

A directive is essentially a function that executes when the Angular compiler finds it in the DOM. The function(s) can do almost anything, which is why at times it is rather difficult to define what a directive is. Each directive has a name (like ng-repeat, tabs, make-up-your-own) and each directive determines where it can be used: element, attribute, class, in a comment.

Types of Directives

Component Templates quite often contain logic in their markup to present complex user interfaces, with lists of data, conditional formatting,
