

etc. For this purpose, Angular2 gives us several useful directives that come in handy. In this chapter, we are going to go into detail on the most important directives.

Structural Directives:

- NgIf, NgFor, NgSwitch, NgSwitch, NgSwitchWhen, NgSwitchDefault

Other Directives:

- NgClass, NgStyle, NgControlName

Some more Angular directives

NgIf

<http://pastebin.com/edit/AD5LaiWq>

This is added to an element in markup, usually to a container like a div.

It can change DOM layout by removing and adding view DOM elements thus it is known as a Structural directive. After the binding is completed, content inside the element is included in the view DOM if the template expression for the 'ngif' is true. And after the binding if template expression for the 'ngif' is false then content inside element is excluded from the view DOM.

It is basically used to exclude or include an element of UI including the child elements.
