

- `nameClicked(event:Event){`
- `this.selectedName = event.srcElement.innerHTML.trim();`

5. This method returns a style object. This method is passed in the current name and returns style for it depending on its selection.

- `setStyles(name:String){`
- `let styles = {`
- `'margin': 6px,`
- `'padding': 6px,`
- `'width' : 100px,`
- `'border': 2px solid black,`
- `color : ((name == this.selectedName) ? "#ffffff" :`
- `"#000000"),`
- `'background-color' : ((name == this.selectedName)`
- `? "#ff0000" : "#ffffff"),`
- `}`
- `return styles;`

Output:

digit1 //Highlighted

digit2

digit3

digit4

## NgControlName

This is a directive used for form handling.

## NgModel

This is a directive that binds a class instance variable to a form control.

<http://pastebin.com/edit/AD5LaiWq>

[HTML markup for 2 fields] with attribute [(ngModel)] = "FirstN". NgModel is a directive that binds a class instance variable to a form control and it is surrounded by two sets of brackets as it is using two way data binding. The [] brackets imply that the bound control get its value from the property in the Class (Model). The () brackets imply event observation. The property in the Model should be updated when user changes bound's control value.
