

The Injector decorator is needed only in case if the annotated class also has external dependencies declared inside its constructor parameters.

The Angular won't find dependencies automatically, we have declare all the annotated classes in ngModule directive's providers field.

- `@NgModule({`
- `imports: [BrowserModule],`
- `declarations: [AppComponent],`
- `providers: [BikeEngine, BikeTires, Bike],`
- `bootstrap: [ AppComponent ]})`
- `export class AppModule { }`

Angular2 Provided Services

Description	Service
For Http communication with the server	Http
Form handler code	Form
Page navigation code	Router
UI Animation	Animation
Eg. NgBootstrap	UI Library

Providers

They are used by dependency injections to register functions ,classes or values. Provider is used by injector class for flow of information so that instance of the object is created to be injected into other. In simple words it is a source if info to create instance of an object. In this info. It includes the identifier of an object and a token. There are three types of Providers:

Class Providers

- Provides an instance of an Object. Most commonly used.

Factory Providers

- Uses a function to provide an instance of an Object.

Value Providers

- Simply provides a value of an Object.

Injectors

Injector is associated with each component that is used with provider to create Object for the Component. It automatically creates child injectors for child component if component have child components. **d**
