

```

• export class JSONPipe
• {obj: Object = { name: {fName: "Paul", lName:"Shan"},
site:"VoidCanvas", luckyNumbers:[7,13,69] }};

```

PercentPipe

It converts the a number into a string representation of a percentage and also adds the percentage symbol (%) after it.

```

• import {Component, View} from 'angular2/core';
• @Component({selector: 'percent-pipe',})
• @View({template: `
•     <h2>Percent Pipe Example</h2>
•     <p>myNum : {{myNum | percent}}</p>
•     <p>myNum (3.2-2) : {{myNum | percent:'3.2-2'}}</
p>}}
• export class PercentPipe {myNum: number = 0.1415927;}

```

Percentage pipes could be used to display decimal values and metrics in an easy to understand way.

SlicePipe

Slice pipe basically creates a new List or a String where the elements present are a subset of the original object.

It accepts two parameters 'start' and 'end', where 'start' refers to the index of the element from where the slice occurs(inclusive) and 'end' refers to the index of the element till which the slice should occur(exclusive).

SlicePipe is particularly useful in collecting sublists of shared or global lists for localized manipulation within a service. They also enable you to copy list of immutable objects with ease.

```

• import {Component, View} from 'angular2/core';
• import {NgFor} from 'angular2/common';
• @Component({selector: 'slice-pipe',})
• @View({directives:[NgFor],
•     template: `
•         <h2>Slice Pipe Example</h2>
•         <p>{{str}} (0:4): {{str | slice:0:4}}</p>
•         <h4>names (1:4)</h4>
•         <ul>
•             <li *ngFor="var name of names | slice:1:4">{{name}}</li>
•         </ul>`})
• export class SlicePipe {
•     str: string = "voidcanvas.com";

```
