

Create a Globally Available Custom Pipe in Angular 2

One of the many out there!

```
• import { Pipe, PipeTransform } from '@angular/core';
• @Pipe({
•   name: 'ordinal'
• })
• export class OrdinalPipe implements PipeTransform {
```

The next step is implementing a method named `transform`, of which is required to create custom Angular 2 pipes. In our case, we are expecting a number being passed in and a string as the return value:

```
• import { Pipe, PipeTransform } from '@angular/core';
•
• @Pipe({
•   name: 'ordinal'
• })
• export class OrdinalPipe implements PipeTransform {
•   transform(value: number): string {
•     let suffix = '';
•     let last = value % 10;
•     let specialLast = value % 100;
•     if (!value || value < 1) {
•       return value;
•     }
•     if (last === 1 && specialLast !== 11) {
•       suffix = 'st';
•     } else if (last === 2 && specialLast !== 12) {
•       suffix = 'nd';
•     } else if (last === 3 && specialLast !== 13) {
•       suffix = 'rd';
•     } else { suffix = 'th'; }
•     return value + suffix;
•   }
• }
```
