

Or invoke navigate method available on the Router class of Angular,

- `this.router.navigate(['/users', currentUser.id]);`

The router considers path segments when matching route path against the current url, hence, the path segment route parameter is mandatory to match the given route.

2. Optional route parameter

If we need to pass optional data, path params are not a good way to do it. Hyperlinks also could pass data in the form of URL query parameters. The Angular router can pass the query parameters to components as well. The url query parameters are optional route parameters and aren't involved in pattern matching and afford enormous flexibility of expression.

For optional route parameters we don't need any specific changes in the route definition. We can specify optional route parameters in routerLink as

- `<a [routerLink]="['/users', { hideAdmin: true }]">All Users</a>`

The hideAdmin parameter is optional to '/users' route and is passed in second element of link parameter array.

Lets develop simple application to test the parameter passing in Angular framework.

We develop simple application with following display,

The example is developed from Angular QuickStart as base, we have added two more component called AbcComponent and PageNotFound. AppComponent has one required query parameter and one optional query parameter.

Routing example
