

Nested routing

Overview

User can navigate between Components 'Child1' and 'Child2' inside the 'Other component'. This change is going to involve modifying the 'Other Component' to contain router links, a Router Configuration and a Router-Outlet. Main app component is modified to change the Routing Configuration for the 'Other' Component to allow it to work with subparts.

Url pattern in below mentioned example-

- 1./home
- 2./other/child1
- 3./other/child2

File 'other.ts'

Add Subcomponent child1 and child2

Code can be found here: <http://pastebin.com/euWNU8tW>

Add Nested Routing

Code can be found here: <http://pastebin.com/ewD2dzE6>

Explanation

- Html template is modified to add links to the Child1 and Child2 components, using the directive RouterLink directive.
- Router Outlet directive is added, this is where the Component is injected into the html markup.
- Directives RouterLink and RouterOutlet are specified so that angular can resolve them.
- Two routes are configured inside the 'Other' component.
- Note: Always specify a default for a Nested Route.
- Constructor injection is used to pass the RouteParams object in to the class, in case id parameter is used.

Creating file app.ts

Code can be found here: <http://pastebin.com/WDQuPZcZ>

Url of the 'Other' component is modified to '/other/...'. This allows the URL to be extended to include sub paths. **d**
