

Sublime is a good IDE to use for Angular

Linting is the process of checking the source code for Programmatic as well as Stylistic errors. This is most helpful in identifying some common and uncommon mistakes that are made during coding.

A Lint or a Linter is a program that supports linting (verifying code quality). We suggest using tslint, it's the best when using typescript.

## TypeScript vs ES6

Although we have used typescript in an Angular 2 based application, and rxjs too (it is also written by typescript). When you write code, which most often depends on node modules: express, node libs and middlewares use ES6, a lot of packages don't have typing definition (d.ts).

Although Typescript compiler (tsc) compile the fastest code, but sometimes it is not the standard way.
