

unlike XLR microphones, you don't need an additional interface to connect it to your computer.

When shopping for microphones, it is important to look at a lot of things. First, you'll need to find one that fits your budget. It is not worth looking for microphones they cost thousands of rupees unless you're really serious about producing content for YouTube. You can get away with using one that does a decent job of capturing audio and clean up much of the noise using a production software.

Another thing to look for is the use case. The type of microphone you need to get depends on the content you want to produce. The microphone which a podcaster needs to use will be different from one who is making music and producing videos. If you look at the types of microphones, they can be categorized broadly into three – Dynamic, Condenser and Ribbon.

Dynamic

Dynamic microphones are the most common type and are pretty inexpensive to produce. These are great for studios where there the requirement of sound sensitivity isn't much. Dynamic microphones are best for recording medium to loud sounds.

Condensor

Condenser microphones are more complex and expensive. They are not the most practical ones as they are very sensitive and can even pick up the sounds of a person's breath when producing sound. They are good in professional studio settings for recording high quality audio, which will undergo a lot of processing.

Ribbon

Ribbon microphones on the other hand are more classic. They were used for high
