

Pick the microphone suited to your needs

quality recordings in the 1950s and continue to be loved for the smooth sound they input. A ribbon microphone is best for someone who wants to add a dash of vintage to the recording. For all practical purposes, you're better off with a condenser or a dynamic microphone.

Another aspect of selecting a microphone is the polarity. A microphone can be unidirectional, bidirectional and omnidirectional.

Unidirectional

A unidirectional microphone is one which picks up sound only from one direction. If you're recording audio from a person, you'll have to direct the microphone towards them in order to capture the audio properly. This can be seen as an advantage as the microphone does not pick up sounds from other directions and eliminates most background noise. If you're hosting a single man show or a talk show, you'll need to set up several microphones to capture the audio streams effectively.

Bidirectional

A bidirectional microphone solves this problem, by picking up sounds from both adjacent directions. This is great for desks where you have multiple people speaking. So if you are going to be running a podcast with guests coming for each session, then a bidirectional mic is good to start with. Move on to two unidirectional microphones later on.
