

Omnidirectional

An omnidirectional microphone is mostly used on stage, to pick up all the instruments and singers. In a studio setting, an omnidirectional microphone may not work well as it can pick up and introduce much background noise. Now that you've taken a look at the types of microphones, we show you some gear you can pick up for varying budgets.

If you're starting out you can get a headset that comes bundled with a microphone for VoIP and calling. A popular one is the Sennheiser PC 8 [<http://dgit.in/2k2mD5b>]. Alternatively, you can also try out the Logitech H390 headphones with mic. These two options are dead simple to use and are plug and play, so you don't have to worry about additional interfaces and drivers.

If you're not looking for headphones, you can buy standalone desktop microphones which will not cost you more than ₹1000. You can even purchase stage microphones and use them with a stand on your desk. For a more professional approach, you can check out Blue Snowball condenser microphones [<http://dgit.in/2jq3gUG>], which are highly recommended for YouTube

content. These are much higher than the basic desktop microphones, but offer a lot of functionality. It is good to invest in a good microphone like the Blue snowball which will not only produce solid recordings, but give you more versatility than cheap ones. This is a basic condenser microphone with a tripod shipped in the box. You can plug these into your computer through USB and have it record instantly without needing any drivers.

For someone with a little bigger budget, you can get the slightly more expensive version of the Snowball, the Snowball MW. [<http://dgit.in/2iU8EB3>]. They have a few design tweaks
