

in a good boom microphone. You also have remote shutters and triggers available for cameras and some advanced models even let you control the zoom and focus using the remote.

If you shoot a lot of video outdoors, you should consider getting a drone with good photography capabilities. Drones allow you to capture unique perspectives and you can shoot events and gatherings with minimal efforts. As we talked about GoPros earlier, you can find several straps, mounts and accessories which let you mount your GoPro anywhere from your head to the side of your car to record video.

You'll also want to get some high capacity storage cards for your camera. These are not very expensive and you can easily add 500 GB without breaking the bank.

Software

The most important part of producing content these days, software has grown in terms of adoption among relatively novice YouTubers. A lot of producers are now using professional grade software to edit and publish their content. Right from cleaning up the audio from the microphone to adding motion graphics, text and logos on to the video. For starters, you can pick something simple such as Windows Movie Maker or Apple's iMovie. These are great for simple editing and allow fairly good control over your video. iMovie can be used for advanced editing as well. For good audio production, you can pick something like Logic Pro. For professional editing, you'll find the standard suite of options from Adobe, Sony and for Mac. You can get Adobe's Premiere Pro or Final Cut Pro X or Sony's Vegas Pro 13. All of them stand out at one thing or two so one might be better suited for a task than the other. You should check the trial versions of the software before deciding to invest in the software. Additional software like Adobe Photoshop or Illustrator might be useful to create graphics for your content. You can import these on to the video editing software you're using and easily add overlays and motion graphics to enhance your video.
