

called a production pipeline. This pipeline is divided into three segments - pre-production, production and post-production.

Pre-production is the ideation and preparation phase. Production is where the shooting happens. And in post-production, you bring everything together to create the final output.

Pre-Production

To make your video making process efficient it is critical to plan beforehand. Although planning doesn't guarantee a smooth process, it brings down inconveniences to a great extent. Pre-production involves coming up with the idea for your video, making a script, creating a storyboard and preparing for the shoot.

Once you have your idea ready you should write it down as a script. A script is a way of writing a story with a set format. There are many formats for writing a script, but all of them exist for two common goals. When you're not the only one working on the video, which most likely won't be the situation, it's easy to communicate your story with a set format, so that everyone is on the same page. Also, writing down your story in an organized manner prevents you from losing track of the details. In the heat of production and amidst the storm of issues you'll come across, it's easy to lose track of your story. The script helps you stay on your vision even when tension rules over.
