

frames would be packed in a single second of video which thus means a larger file size. And as discussed before, a larger file size of a video might not be an optimal option for everyone.

You need high frame rates only when you're shooting fast actions, as low frame rate makes the actions appear blurry. For something like a dialogue between two people, high frame rate becomes unnecessary. This is another example of where your planning makes the process efficient or effective. Knowing that you'd be making a comedy slice-of-life video, lower frame rate will save up on the file size and if you had action-packed scenes, a higher frame rate would make it more effective.

An interesting creative tip if you're making a movie about a person who lives two lives. One side there's an average person, regularly going for a job and then, on the other hand, the same person is a crime fighter. You could give a subtle differentiation between the two worlds with two different frame rates. Slow one for the monotonous job and higher for the crime-fighting action.

Your camera is now set and ready to record a viral. But it still needs something, a support. Handling the camera is also a creative choice. You can either stick the camera on a tripod for something like a tutorial or an explainer video. Or you can go handheld if you want your viewers to get in the action with the characters. This choice, unlike resolution, aspect ratio and frame rate, is solely based on content.

And now you're ready to shoot. But what will you shoot? What angle or how much of a scene will you shoot? This part here is called framing. It is basically decided what part of the scene goes where on the frame and is viewed from what angle from what distance. Remember the storyboard? Those drawings of all the shots you made will now become a guide to your framing. Obviously, you couldn't have drawn or planned the whole video with just drawings, so be free to make some changes on how you frame your shots.

Camera framing and movement is an incredibly vast topic. There are literally months of college programs and then years of experience attached with this. Therefore, covering this topic in detail would be impossible through this article. Instead what I would do is, kick-start the thought process.

Camera Framing

The primary rule of framing or composing a shot is the Rule of Thirds. The rule requires splitting a frame into nine equal rectangles using two vertical
