

cutting away to a close-up of what exactly you are doing can do the trick as well.

While shooting the characters, it's also important to shoot B-roll footage. B-roll are shots which don't show the characters, but they're related to your video. Things like shots of the background, props or the product you're reviewing. These help in breaking the monotony of constantly looking at the actors.

In the camera movement department, there are a few terms too. These are basically names of the movements of the camera. Panning is turning the camera horizontally and tilting is turning the camera vertically. Both happen without moving the camera around, just turning on the pivot. If you have a budget to purchase a dolly or a slider, you can also take trucking and tracking

Tracking shots create a parallax effect to your videos

shots. Trucking is when you move the camera forward or backward. Note that trucking and zooming are two different things. Zooming is when you use the lens to move your frame closer to the subject, but trucking requires physical movement of the camera. How are the results of both different? The most difference is seen when your scene has depth in it. Trucking in would create a parallax effect which would further strengthen the depth. Whereas zooming would not give a similar result. Tracking is when you
