

move the camera from left to right or vice versa. These four are the primary camera movements and therefore suited for beginners to use. If you require some other camera movements, you can combine these to attain results.

Just like framing, even camera movements are content specific. Different types of movements for different scenes open doors to a plethora of emotional impacts. In the principal's office example, instead of cutting the shot from a long to close-up, trucking in the camera on the character would build tension slowly. Almost like opening a gift box of terror, one flap at a time. You can even present the same scene in a different way by trucking out from a close-up to a long shot. This would invoke a sense of revelation in the audience. There are tons of ways you can use these four camera movements in a variety of scenes. It's best to try and watch your scenes, again and again, to understand their impact on you as an audience, better if you can find someone to watch and review it.

When you're shooting, do not start the acting just after pressing the record button. It takes around a second for the recording to start. These extra few seconds you spend doing nothing in the scene are part of a pre-roll. You can cut this bit while editing.

Post-Production

Welcome to the final stretch of your project. This is where your video comes into existence from the pile of footage that you've shot. The process of taking your footage, cutting it and places it in an order which creates a story or your output video is called editing. Take the videos of all of your shots and dump it on a computer inside a single folder.

Folder management is important at this stage. Create a folder for your project. This is where everything related to your current video will go. Create another folder and name it something like 'footage'. This is where you'll keep all your recorded videos. Next, create another folder you editing software project file. Editing software usually have temp files and other kinds of files along with the actual project file. Keeping it in one place will increase organization. If you plan to add some sound or music (you should), create another folder for that as well.

Alright, it's time to make a video.

Editing

In modern times, editing happens through a software. In the good ol' days of negative films, parts would be cut and pasted together into a new reel
