All of the software mentioned above have a free version. So that you can give them a spin before deciding on one.

If you're planning to make tutorial or review videos, a good option is to have shots from multiple angles and B-rolls. This will break the monotony for the viewers.

If you want to work on story-based media, then things become a little dense. Best advice is to read about editing techniques used by most or major filmmakers. But just to kick off a few things, here are some tips. Remember that placement of shots on the time line define your story, as it was made clear with the example of principal's office. Pauses help to develop a scene. Giving audience time to analyse the situation and making them think, immerses them more into the story. The first shots of every scene or the whole film are called establishment and it is important to use this as a hook. The most establishing shots are either those that declare the environment, panning through a street or trucking in closer to a house where the story takes place. They can even be tight close-ups. Such establishing shots build tension and are best used for thriller stories.

After you've laid down your shots in a story, you can use the editing software to add some background music and sound effects.

Done, you have your video ready. All you now need is to export the video.

Rendering

Rendering is the process where all of your graphics, effects, audio and edited shots are compiled to become a video file. A lot of software have presets to render for YouTube at different resolutions. If your software doesn't, here's what you need to know. There are three most important things to take care
