

of when rendering - format, bitrate and resolution. YouTube accepts - .MOV, .MPEG4, .AVI, .WMV and .FLV. These are called containers, so if you see that option, pick any of them. In the video codec option, select H.264. Bitrate is the rate at which a video's data is loaded by the player. Bitrate requirements increase with resolution and framerate. The table below should help in picking a bitrate.

TYPE	SDR	SDR	HDR	HDR
	Bitrate (24-30 FPS)	Bitrate (48-60 FPS)	Bitrate (24-30 FPS)	Bitrate (48-60 FPS)
2160p (4K)	35-40 Mbps	53-68 Mbps	44-56 Mbps	66-85 Mbps
1440p (2K)	16 Mbps	24 Mbps	20 Mbps	30 Mbps
1080p	8 Mbps	12 Mbps	10 Mbps	15 Mbps
720p	5 Mbps	7.5 Mbps	6.5 Mbps	9.5 Mbps
480p	2.5 Mbps	4 Mbps	Not Supported	Not Supported
360p	1 Mbps	1.5 Mbps	Not Supported	Not Supported

In the case of audio bitrate - 128 kbps for mono, 384 kbps for stereo and 512 kbps for 5.1.

Hit render and voilà! You have your first video ready for YouTube.

Conclusion

Filmmaking is an art and thus requires time to develop. Learn from others and keep reading about different techniques. The tips mentioned above are just a gateway. Cinematography and editing are two massive subjects in filmmaking and have more than a century's worth of knowledge available. Over time you'll be able to come up with your own style, your own combination of shooting and editing techniques. Welcome to the world of filmmaking!
