

compatibility as a priority. MSDOS games were finally catching up and the genre of point-and-click adventure games would come into existence by the late '80s. Companies like LucasArt were developing gems like *Zac McKracken* and *Secret of the Monkey Island* and these were distributed as CDs and could be copied by file compressing into floppy disks. It was difficult creating pirated copies of the cartridges but this was not the case for PC gaming and it didn't take long for piracy to become a big issue. Companies tried to resolve this problem by including unique code's which would only be accessible after you have purchased the game and was needed to activate the game. Hackers found their ways around it somehow and piracy in computer games is still a huge issue to this day. As the '80s came to end, there was a shift seen to CD consoles and then something amazing happened.

The Sony PlayStation

Nintendo released the more powerful Super NES and the newer consoles aimed at giving full 64-bit experience. For the first time, games were created keeping a mature audience in mind. Games like *Mortal Combat* and *Project Grand Theft Auto* became huge success with the consumers. This led to the first Senate investigation on the violence these games had. This led to the introduction of the rating system that still exists which was made mandatory to be displayed at the packaging of the video game. In 1994, a well established Japanese company launched a new CD based console called PlayStation. This console would go on to become one of the most important gaming consoles ever and leave Sony with a legacy and a stronghold over

Sony had some amazing games for their new console
