

the gaming industry that they still possess. Sony not only had titles they developed themselves, but also developers all over the world release games compatible on their system. It was Sony's excellent branding and the plethora of amazing titles available for purchase that made the PlayStation the first computer based console to ship 100 million units. Nintendo launched the Nintendo 64 to compete with this super successful console. They decided to stick to their guns and kept their cartridge system intact. Nintendo 64 sold over 30 million units. Now games were better protected against piracy.

After the PlayStation there was no going back. CDs had become a standard distribution medium. Computer games were getting better too and continued to be sold as CDs.

There were a lot of new arcade games which focused on ride-and-play style of gameplay like driving, skiing etc. This kept the arcades relevant throughout the '90s.

Ever since then, as you have read in the previous chapters, console after console has been released by the three giants – Sony, Microsoft and Nintendo.

CDs have stayed to be the popular choice as they are easy to manufacture and can be shipped with ease. DVDs were used for PlayStation 2 and Microsoft Xbox. Then as the age of consoles like PlayStation 3 and Nintendo Wii ushered in, there was a shift towards Blu-Ray disks for the simple reason that they were more durable and can hold way more data than DVD's. CDs remain to this day the most popular medium of game distribution. Piracy in consoles has been solved to a certain level by allowing clever software tricks

The PSP used UMD to make the game run. Nintendo still uses cartridges for the handheld consoles.
