

In terms of pricing, the Oculus Rift stands somewhere in between the PSVR and the Vive. For \$599 you get the headset with headphones attached, a tracking camera on a stand, a secondary remote controller, an Xbox One controller with a dongle included and the good ol' wires. As with the PSVR, for full immersion you would need to separately purchase the Oculus Touch Controllers which will set you back another \$199. Now the "only" thing missing is a PC with monster specs.

At launch HTC Vive had the mightiest price tag, \$799. But it included a lot of things in the box. Apart from the headset, the package came with a pair of controllers specifically designed for VR, two motion tracking cameras along with wall mounts, rechargeable battery stations for the controllers, a hub for all the wiring that connects to the headset, extra foam padding and truckload of wires. Compared to other three, the Vive comes packaged with everything you need, except a PC powerful enough to run it.

System requirements and Setting up

PSVR has the least complex system requirements, works with any PS4. On the other hand, Rift and Vive have slightly complicated requirements. Rift needs an Nvidia GeForce GTX 970 or AMD Radeon R9 290 or better graphics card, an Intel Core i5-4590 CPU or AMD FX 8350 or greater, more than 8 GB RAM, HDMI 1.4 or newer, 1x USB 3.0 port and Windows 7 SP1 or newer. On the other hand, the Vive requires pretty much the same firepower along with a DisplayPort 1.2 or newer, 1x USB 2.0 or greater ports.

Just like its system requirements, PSVR is the least complicated. Connect the PS4 extension to the console, connect the headset to the extension, connect the PS Camera to the console and boom, you're done. For the Rift and the Vive, there's much more wiring and software installations needed. And don't forget the updates. Plus, for Vive, you would even have to set up the tracking cameras according to your room and also set the tracking area on the software end.

Comfort and Looks

With PSVR's extensive array of cushioning and easily adjustable head band, it's the most comfortable headset to wear. The design of the PSVR is also such that you feel the clamping pressure on your head and not on the face. The Rift too has great cushioning, though not as robust as the PSVR. The Vive lands lies at the extreme end of the line in terms of comfort. Both, the Rift and the Vive put pressure on the area around eyes and nose, which can get really irritating.
