

Both HTC and Sony don't want to simply drop a headset and wait for others to develop peripherals. HTC's Vive Tracker is a puck-like device which can be attached to anything and turned into a VR controller. At the time of reveal, HTC showed it being used on a gun and even on a baseball bat. It is essentially another platform altogether where, developers can make software which link to a variety of objects through the Tracker. Developers have already started building hardware to use the Tracker. One of the developers attached a smartphone and a tracker to a gun, allowing more players to hop in a multi-player VR experience. Manus VR made a glove which works with the tracker to show the whole arm of the user along with movements of the fingers. HTC also revealed a possible future of wireless VR with a wireless adaptor by TPCast. Impulse Gear partnered with Sony to make PSVR Aim controller which is a gun-like controller. It is based on the PlayStation Move, but improves it much more.

Virtuix Omni adds an extra level of immersion to your VR experience

Leap Motion had been around since long, but the hand tracker's compatibility with VR and its size still intrigues people. Virtuix Omni is an omnidirectional trademill-like large peripheral which allows players to translate real world walking into in game movement.

With the demand for making VR wireless, a trend of VR backpacks emerged. HP, Zotac, MSI and Alienware are working or already have VR-ready PCs which can be packed in a bag, rendering the headset wireless. Zotac and MSI have already released their iterations, but with a hefty price tag of \$1,999 and \$1,899 respectively.

### **Wonderland Gateway: Mobile VR**

Daydream, Gear VR and Google Cardboard make for a good start into the world of VR. They don't demand a giant price tag or monumental power, just your smartphone. It's a simple premise, at the screen end of the headset
