

Google's betting big with Daydream

Which most often is really uncomfortable. Even though Gear VR ups the game of comfort, it just doesn't reach the cosiness of Daydream View.

But what can you do with a mobile VR headset? Well, it's mostly video content. Companies like HBO and Hulu have VR capabilities. Plus, there's Google's own line-up of experiences and YouTube. As for the gaming category, there are few VR versions of popular games like Crossy Roads, Hidden Temple, Minos Startfighter VR, Proton Pulse and 'Chair in a Room'. There's also a free third-party controller by Realiteer which is compatible with Cardboard and a few games, Wizard Academy is one such title.

The Present and the Future

Despite the incredible immersion of VR, adaptation has been slow. Mostly due to the high costs of high-end hardware and lack of meaningful content for mobiles. Due to the small distance between the eyes of the viewer and the screen, the viewer experiences something called the screen-door effect and many high-fidelity enthusiasts are easily disappointed by VR. It's a loop, people aren't willing to switch to VR due to lack of content and technology, and the companies aren't investing due to lack of player base. The hype-rich start has propelled the industry better than ever, but ultimately only time will dictate if VR would really achieve mass adoption. Or as it was before, we'll face another VR ice age. **d**
