

unless you are an avid gamer or someone who intends to become one. Since you are already reading this, we assume that you belong to either of those categories.

So, to answer the all-consuming question, we say that it's the PC which is better than the console for gaming. Of course, having the latest Xbox tucked away in the corner of your room may be a neat way to impress your visitors but there are good reasons why you should prefer the PC.

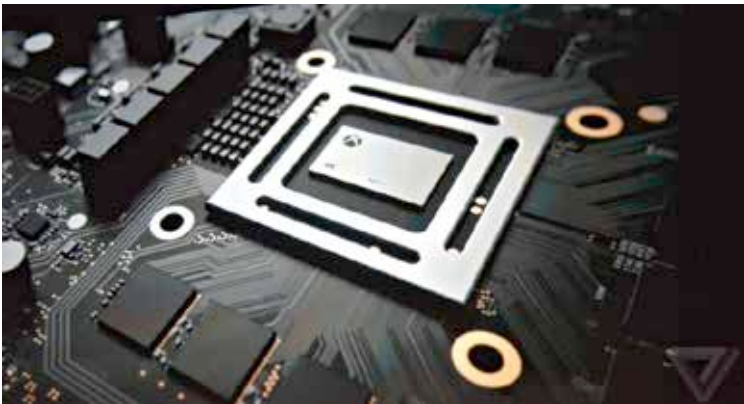

So, without further ado, gaze upon the reasons!

Better upgrade path

Gaming consoles these days make use of faux-PC upgrade strategy. It's expected that consoles would soon become modular platforms – which includes multiple tiers of hardware along with ever more powerful units coming out every three or four years. And all the big companies including Sony and Microsoft are in the fray.

The catch is that consoles are not all that great at upgrades. In fact, it's no exaggeration to say that upgrade is not possible at all with consoles. It's evident by the fact that you don't upgrade PlayStation 4, you just try to sell it when the next version hit the market.

The PC is more expensive up front, no doubt about it. However, the upgrade path in the later periods is assuredly easier. If you are budget conscious, then you could probably use the same processor for about six years at least. Not just that, the same graphics card could be used to four or five years. Also, there is a whole array of stuff – including the RAM, Cabinet,

Easier upgrades on PC
