

Better controls on PC

easily. The controls with the PC are not just more precise and responsive compared to a controller; they are also way more approachable for the new gamer.

Yes, there's the fact that many console games are available on PCs these days, making it somewhat desirable to play them using the original control scheme. Titles like 'Assassin's Creed' and 'Dark Souls' are cases in point. There's no doubt that these games are played better on a gamepad. However, it's rather easy to connect a DualShock 4 or an Xbox One controller to your PC – whether wired or via Bluetooth. Also, to make things even simpler, most of the games support controllers on the PC – and this is particularly true with huge multi-platform releases.

The other reasons why you need a PC

Straying away from a strictly gaming context, there are probably other good reasons you may find for a desktop. Sure, laptops may be suited for day-to-day commuting or maybe you are someone who could get all the work done using a tablet.

However, there are many people who find the desktop computer rather useful. For instance, those who do image based or film/ audio works. Then, there are those who work on their own games, as well as those whose job demands long hours of typing – something which a comfortable chair in front of a good monitor would make a whole lot better. And of course, there are the 'old fashioned' ones who like a meaty keyboard and a pretty big screen to go with it – or is it the other way around?
