

WHAT MAKES A ROBOT?

A deeper look at what really constitutes a robot.

What makes a robot?

Robots of the 21st century are set to be able to mimic human beings in the most uncanny of ways. Today, we have individual robots that can match and even exceed humans at specific tasks. There are robots that can sort items, process images, navigate obstacles, follow and track down sounds, fly, walk, swim, and even dance! Just as the human body is composed of numerous systems and subsystems, all governed by an inherent structure, so are robots the product of a tenuous design process that pieces together exactly the functionality that was desired, nothing more, and nothing less. Robots are thus the product of a magnificent design cycle - a cycle that in
