

'Robots could be performing 100% of the surgeries in the future'

fact, these robots have great precision and can perform very fine incisions and have a great application.

3. Robot Laws

Scientists predict that the times to come will witness new laws being formulated, especially in the fields of space travel and robotics. We all know the three basic laws of robotics from the previous chapter. But other than those, there are a lot of gray areas where the laws are still not defined. For example, scientists predict that by 2050, we will witness the first human robot marriage! Also, if you have a pet robot, do you buy an airline ticket for it? There are many such unanswered questions, simply because there hasn't been a need to answer them yet.

4. E-commerce

Robots will find huge application in the manufacturing and development aspects of commerce. Complex machines have been used for a while now to make the process of manufacturing easier for humans. These machines are constantly improving and can now be programmed to function with zero human input. Imagine a factory run entirely by robots and machines. You would no longer need to worry about human error and only resources
