

MOTHERBOARD / MAINBOARD

It's the underlying fabric that holds the entire machine together. Motherboard comes in all shapes and sizes.

If the CPU is the brains of the system, the motherboard must be the backbone to which everything else is connected. MotherBoard, sometimes also referred to as MainBoard and sometimes simply, the Board is the largest component inside the CPU cabinet to which your processor, RAM modules, graphics card etc. are connected. It has the system buses, chipsets and power lines for components attached to it.
