Documentation

Irrespective of the complexity of code, any good code should be well documented. Documentation is imperative to the creation of good long-lasting software. Effective documentation helps in building, updating, and using the software.

There are two kinds of documentation, internal and external. Internal documentation is usually in the form of comments. Comments should be terse when possible and clearly show what the purpose of the code is. Here are some good practices for commenting programs.

- Have standard commenting practices
- When modifying code, always keep the commenting around it up to date.
- At the beginning of every module, it is helpful to provide standard, proper comments, indicating the routine's purpose, limitations, and assumptions. A boilerplate comment should be a brief introduction to understand why the routine exists and what it can do.
- If your comments explaining a function are only a few words long, ask yourself if you can better name the function and avoid the comment itself.
- Use complete sentences when writing comments. Comments should clarify the code, not add ambiguity.
- Use comments to explain the intent of the code.

Format

Why is formatting important? Because proper formatting makes your code stand out. It appears modular, consistent and logical.

Well-structured and formatted code looks clean and is easier to read, for you as well as for any developer that works on your code in the future. A readable code is one which can be easily maintained.

There are simple steps that can be followed in order to achieve consistent formatting.

- Try to have a standard size for an indent, such as same spaces, and use it consistently. Align sections of code properly using the prescribed indentation.
- Use a monospace font when publishing hard-copy versions of the source code
- Apart for constants, which can be best expressed in all uppercase char-
