

really counts as a mobile device but we'll throw it in here anyway. With the advent of 5+ inch smartphone screens being the norm rather than the exception, tablet sales have declined steadily. Added to the fact that there is pretty much no competition from the Android side, everyone who *does* want to get a tablet ends up getting an iPad. Think about it – how many people you know own a tablet and how many of those are iPads? Apple has three lines of iPads currently – The iPad Pro, the iPad and the iPad Mini, in a wide range of screen sizes from 7 inches to 12.9. There are differences both significant and nuanced between all the models so we'll save the discussion for the main section on iPads for next month's issue.

## Desktops

Apple's ticket to fame – the Macintosh. From 1984, millions of people have been swearing by them for work and art alike and for good reason. The Mac has been evolving steadily through the years and now, it's available in 4 main variants – The Mac Pro, the iMac, the iMac Pro and the Mac Mini. The Mac Mini is the cheapest of the bunch and it doesn't take too much thinking to figure out why. Meant for people who are tied into the Apple ecosystem but can't afford the bigger, meaner machines, the Mac Mini is a solid, small about 8inch square-cuboid that packs decidedly unimpressive specs under the hood. Talking about looking good, the Mac Pro definitely doesn't. The industrial, seamless design is fine and all but once you start looking at it like a trashcan, the image is burnt into your head indelibly. This is one of the *most* expensive computers you can buy today – with specs that are years out of date. While both the Mac Pro and the Mac Mini are in dire need of upgrades, there are two spanking new iMacs on the block. Both of them are all-in-ones, meaning the computer is integrated into the display. The iMac Pro comes out this December (perhaps packing an 18 core Xeon and Vega graphics!) so get those kidneys ready. More on iMacs in the next chapter.

## Entertainment and Misc.

Read the above subhead as 'Literally Everything Else'. We weren't kidding when we told you Apple has lots of fingers in lots of pies. Apart from the main tech trifecta outlined above, Apple also offers a sinfully expensive but pretty darn good smartwatch under the Apple Watch series; music players that were once literally ubiquitous but now rather difficult to spot; a recent and surprising foray into home audio with the HomePod speakers and
