

The Macintosh ED, an early release

the layman. In fact, Raskin wanted to name the product after his favourite kind of apple, the McIntosh – also a reference to the name of his own company. Apple was later forced to buy the rights for the name from the apple company, even with its changed spelling.

Steve Jobs introduced the first Macintosh in 1984 as Apple's first personal computer for the mass market with a graphical operating system. It was retroactively renamed the Macintosh 128k to retain the usability of the 'Macintosh' name.

The first Macintosh was introduced by a television commercial titled '1984', the year of its release. The commercial, that cost Apple USD 1.5 million, depicted the arrival of the Macintosh as a deliverance that would save humanity from the "conformity" of an IBM dominated computer market. The ad alludes to George Orwell's iconic novel, 1984, and is widely considered a 'watershed' release.

Over the years, the Mac, in its various avatars, has cemented itself in its position as an elegant, powerful, and beautiful machine. The gravitas of its public image and pragmatism of its design continue to complement the stature of Apple as a company.

What kinds of Macs are there?

Since the first Macintosh in 1984, Apple has pioneered incessantly, with landmarks like introduction of the first ever USB port and the compact disc (CD) drive taking great impetus from the company's R&D. As of 2017, the company has an impressive line-up of products under the Mac name.

iMac
