

the thermal engineering marvel of rotary placement of the cores around a narrow aluminium heat sink. Impressive? Sure. Costs a bomb though.

iMac Pro

The iMac Pro is the iMac's power level taken up to 9000. Promising 18 cores and a slew of killer features to compete with the Mac Pro. Best part? It's all in the familiar iMac desktop frame, exact same size, an even better display (5K this time!). Besides, it offers an astounding (for its compactness) 32 gigs of RAM, 1 TB solid state hard drive memory, Radeon graphics card with 8 gigs reserved for visuals, As of July 2017, it is yet to be released, with a December date looking likely.

What is a Mac made of?

Apple is a known stickler, and the ingredients of its amazing computing machinery are sourced and ordered from a cherry-picked few manufacturers. Compared to a generic software company that develops software for wide compatibility with a variety of hardware, Apple has tight hardware-software integration and is extremely picky about where its hardware comes

The *ingredients* of the Mac G5
