

do a web search and the content it finds can be dragged into your working document right away. This leads you to improved productivity.

In addition to this, Siri results can be pinned to the Today section of the Notification Center. For example, if you ask Siri for the score of a particular game and then pin it to the Notification Center, you can see the updated scores right there every time you open the Notification Center, just like widgets.

Optimised storage

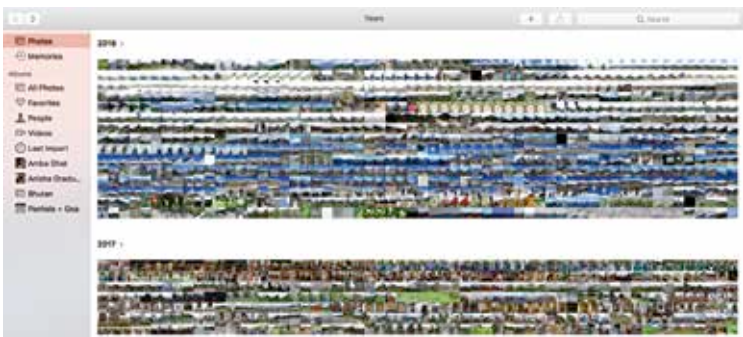

There's an optimiser provided in the macOS that optimises your storage space. It keeps a track on the files that you use frequently and based on that decides whether to keep it on the computer or on the iCloud drive.

It scans and deletes used app installers, duplicate downloads, caches, logs, etc. Similarly, the files that are uploaded to iCloud include ePub books that you have read, old screenshots, iTunes U courses that you have completed, full-resolution photos, unused App Store apps, old documents, unused fonts, etc.

Some files are permanently deleted. These include Apple Music caches, inactive iTunes downloads, cached Map tiles, trash items after 30 days, IPSW files from iTunes, inactive App Store downloads, old iPhone backup, etc.

Revamped Photos app

The Photos app recently received a massive overhaul and brings some of the coolest features from iOS to macOS. The Photos app now recognises faces in the photos, and of course you can even add names to these faces. Using this, your images are properly organised into a "People" album. It can also recognise over 4000 different items such as sunsets, beaches, cakes, etc.

As you zoom photos will be categorised by months, weeks, days
