

Continuity

Since OS X Yosemite Apple offers call relay feature that lets you place or receive calls on your iPhone using Mac. This is a handy feature for all of us who often keep our phones unattended while working on our computers.

To make this feature work, you need to connect your Mac and iPhone to the same WiFi network. In addition to this, both the devices should be logged in to same iCloud account. With these settings turned on, you have to enable “Calls from iPhone” in the FaceTime preferences on your Mac. Similarly, on your iPhone, you need to enable “Allow calls on other devices” under the Phone tab in the Settings app.

Handoff

Handoff is another cool feature that lets you start something on one device and finish it on another. In simpler terms, if you are browsing a web page on your Mac and have to leave your keyboard, you can continue browsing the page from the exact same location on your iPhone or iPad. This works with a variety of apps such as Mail, Safari, Maps, Messages, Reminders, Calendar, Contacts, Pages, Numbers, Keynote, etc.

Check “Allow Handoff between Mac and your iCloud devices”

To make Handoff work, you need a Mac that supports Bluetooth LE, you should be logged into the same iCloud account on your Mac and your iPhone or iPad. Additionally, both the devices should be connected to same WiFi network. Once these requirements are satisfied, you can enable Handoff from General tab in the System Preferences on your Mac.

Is there anything macOS could do better?

Although macOS is a rich and feature-packed operating system, it does have some tradeoffs. One crib is that Apple is systematically eliminating old Mac hardware from the latest updates.

Starting from macOS Sierra, Apple has eliminated the support for Mac hardware before 2009. So if you are using the latest Apple hardware you can make the most of these features. Most of the features work well with all
