

WATCHOS AND WATCHKIT

The software that keeps the Apple Watch running like clockwork

The operating system powering Apple's smartwatch is dubbed watchOS and was first showcased to the world on 24th April 2015. WatchKit is the framework provided by Apple to third party developers to let them develop interfaces and applications which could run on the watchOS.

The first version of the OS that powered the first Apple watch was limited in both its scope and functionality. It came with a limited set of apps and no support for third party applications, but still managed to give stiff competition to devices powered by the android wear and fitness trackers.
