

Manage your activities easily with Apple Watch Series 2

The Watch OS v2 also had better fitness capabilities, including a real time heart rate monitor and options to save and share workout activities between your iPhone and watch.

Along with this update also came significant Siri improvements like letting you start a workout routine, get directions, do calculations and even look up words in the dictionary. The latest version also supported video playback and Facetime.

Watch OS v3.x

The third version of the watchOS was a massive improvement over its predecessors and came loaded with many new features.

A 'Dock' section was added that let you add 10 of your favourite and most used apps to it and can be accessed by pressing the side button. This lets you access these apps quicker than the traditional menu.

The v3 also did away with 'Glances' and replaced it with the Control Center similar to what you see on iOS. Swipe up from the bottom to access it and you could see the battery life, toggle between airplane mode, silent mode, do not disturb, or lock your smartwatch.

Another nice addition was the SOS feature which could be activated by holding down the side button. It is a universal feature which will work
