

regardless of where you are, contacting the nearest emergency services if your phone is connected to the watch, or using the internet if you are on Wi-Fi.

Fitness bands give straight competition to smart watches and realising this the Apple Watch upgraded its activity app. A new feature called activity sharing let you share your activity and fitness stats as messages with your friends and families directly from your watch. Imagine setting a new track record and showing it off to your friends straight from your wrist.

The way you responded to messages was also changed with smarter and quicker ways to reply added. Shortcuts for voice message and emojis were added and something called Scribble was too, which let you reply to a message straight from your watch, by typing out one letter at a time. That might seem like a more tedious way, but well that's one way to show off your Apple Watch-scribbling replies on your wrist, one letter at a time.

Many new faces were also added including a minnie mouse one. This update made apple watch a more practical device overall.

## Watch OS v4 – the future of Apple Watch

At this year's annual WWDC, Apple showcased watchOS4 – the future of Apple's smartwatch OS. The beta version was recently made available for developers, while it will be officially released en masse to the public in September this year. Here's a rundown of the features the new update will be carrying.

Apple was the first company to add a voice enabled smart AI assistant on their smartphones. Siri has been a part of their Smartwatch since the first model came out, but it was limited in scope. With the latest release, Apple aims to change that.

- The watchOS 4 will feature a Siri watch face, which will use machine learning to display relevant information and app shortcuts right on

Now choose who you want to tell you the time- Buzz Lightyear, Woody, Jessie, Minnie or Mickey
