

An application for Apple Watch has two parts – one that runs on your iPhone and the other that runs on your Watch. The part running on your watch is actually just showing you the user interface and taking your input, and sending it to its counterpart running on the iPhone, which does the whole processing.

This part that runs on your iPhone is called the WatchKit extension which communicates with the app on the watch using the WatchKit framework

How does watchOS fare against its competitors?

The smartwatch OS market started off with many competitors trying to gain dominance in a new market. These included Apple's watchOS, Android Wear, Samsung's Tizen, Pebble OS and other lesser known and now defunct OSes including Firefox OS for Wearables, and software, which can't exactly

Points scored

Global Smartwatch OS marketshare for Q1 2017

be called operating systems, but are used to run various other fitness bands and 'semi-smart' watches. Around the year 2014, when the mainstream smartwatch market was born, most of these watches were merely digital watches with a touchscreen and some gimmicky features, with the OS running on them being just bare bones. Fast forward three years, we have smartwatches that come loaded with AI assistants, ability to control your smart homes and devices, reply to messages without even taking out your phone from your pocket, and also, tell the time.
